Table of Contents

I. Introduction [*](#)

II. Step generation and propagation [*](#)

A. Step (growth layer) generation [*](#)

1. Dislocations, 2D nucleation and crystallites [*](#)

2. Localization of 2D nucleation: bulk-transport non-uniformities and defect pinning [*](#)

3. Evolution of the dislocation sources of growth layers [*](#)

B. Kinetics of step propagation [*](#)

1. The kinetic coefficient for incorporation into steps [*](#)

2. Inter-step interactions [*](#)

III. Defects, strain, and molecular disorder in protein crystals [*](#)

IV. Unsteady growth kinetics and step bunching [*](#)

A. Phenomenology and dependence on transport parameters [*](#)

B. Correlation between unsteady kinetics and crystal imperfections [*](#)

C. Macroscopic models of kinetics unsteadiness and feasibility tests [*](#)

1. General considerations [*](#)

2. Numerical model [*](#)

3. Simulation results [*](#)

V. Microscopic mechanisms of instability and step bunching [*](#)

A. Linear stability predictions [*](#)

- B. Numerical simulation of suspected incorporation pathway [*](#)
- C. Stability with respect to small perturbations [*](#)
- D. Experimental evidence for the role of perturbation type and magnitude [*](#)

VI. Control of kinetic unsteadiness [*](#)

- A. Experiments with flowing solution [*](#)
- B. Suppression of unsteadiness with faster bulk transport [*](#)

VII. Impurities and kinetic unsteadiness [*](#)

VIII. Rationale for system-dependent effects of bulk transport changes on crystal perfection [*](#)

- A. Pure solutions [*](#)
- B. Impure proteins [*](#)
- C. What should we do before conducting low-gravity experiments [*](#)

IX. Does step bunching contribute to the slow protein crystal growth? [*](#)

X. Concluding remarks [*](#)

XI. Acknowledgments [*](#)

XII. References [*](#)
